The Presets panel is still where Photoshop's Adjustments are applied to the image. This view is also where the Clarity and Sharpening sliders are located. There is an Add-ons section for adjusting the Curves tool, a Filters section, Variables, and a Profiles panel. There is a New Layer option for a few different uses. After you create a new one, you can stack two or more on top of each other, for example. You can then combine them with an option for different opacity settings. The Layers panel still allows you to label layers. The New folder indicator has been replaced by a New in version number symbol. The Shadows and Highlights view now also indicates the filter settings. You can now adjust the brightness on the right-hand side based on the Shadows and Highlights settings in the image. There is a New Shadow/Highlights area in the Layers panel as well. Clarity and sharpening are also available in the Adjustments panel. The additional Sharpening option allows you to select the amount of sharpening as a percentage or by Layers. There is a new option to crop the image horizontally and vertically, and then straighten them. You can also crop the image to specific areas or a whole-picture crop. Float Selection seems a little less stable than it did in version 4.0. I can't tell for sure, as I don't use it, but I think it feels different. The new Invert, Curves, and or Recolor adjustments allow for various possibilities when inverting and recoloring images. You can change the hue, saturation, and brightness values of the image. Curves offer more options and can be used for more purpose than the new Invert adjustment. The new Colorize adjustment creates a tinted image using the specified RGB value. You can apply a tint to an image, even make the image greyscale.
