PostgresToMsSql is an easy-to-use tool for transferring data between the PostgreSQL and Microsoft SQL Server databases. The software supports multiple tables, including single tables and entire databases. You may also select the rows you wish to export from the source database. In addition, you may configure how you wish to update or append to the destination database. You may also save the current sessions, so you do not have to start over if you encounter an error. PostgresToMsSql also provides a range of options to control the transfer. Not only can PostgresToMsSql copy the information from a database to a different location, but it can export the fields, columns and tables, as well. Moreover, the destination of the transfer is another data structure. Thus, the software facilitates the export of information and tables from a PostgreSQL database to a SQL Server schema. PostgresToMsSql allows you to export single tables, configure the rows you wish to transfer, or deselect those you wish to ignore. You need to select the destination database, from Microsoft SQL Server, find the exact table or create a new one. Moreover, you can choose the data transfer method: you may append the existing information in the destination table, replace or update it. PostgresToMsSql supports transferring a series of tables from PostgreSQL and even allows you to select the entire schema. Similarly to the single transfer, you can configure the rows you wish to transfer. The preview area displays the list of tables selected for export and the chosen destination. The area at the bottom of the window allows you to view the progress bar and an activity log. In the single transfer mode, it also offers a preview of the results of the export. PostgresToMsSql allows you to create queries in order to define the parameters of the transfer and control the process. PostgresToMsSql features separate wizard functions for each type of transfer, thus guiding you through every step of the process. Additionally, you may automate the transfer task, by setting up a schedule and indicating whether or not it should be repeated. The software also supports saving the current sessions. PostgresToMsSql will do all of the work for you. It can be used as a stand-alone tool or as a tool you use as a front end for a tool that transfers data to SQL Server or PostgreSQL. The program is easy to use and provides you with support for performing the transfer even

For single egg cycles the most likely time this will happen is day 5 or 6 after the IUI. For multi-cycle transfers it is usually around day 14. It is not as random as a lot of people think and if you want to improve your chances you need to identify your LH surge and if you want to maximise your chance of a single heartbeat transfer this is best done before oocyte retrieval. I am always told by IVF clinics that the patient needs to know at what stage the transfer is supposed to be done. As no one knows your situation until after the two week wait you cannot plan your cycle around your FET cycle. The IVF clinic sees this as a flaw in their system and try to tell you that they should not take chances. This is a statement by a senior IVF team. If your clinic makes a similar statement you should question why they are telling you that they cannot and will not take a chance with your pregnancy. This is a common thing when you are trying to conceive. It is a statement that you cannot time your cycle and it must be done early. If you
